We are conducting a study to determine if Transcutaneous Electrical Nerve Stimulation (TENS) will reduce neck or back pain in women with fibromyalgia during activity and decrease pain sensitivity.

FAST (Fibromyalgia Activity Study with TENS) involves 4 clinic visits that will take about 2 hours each and will occur over a two month time period at the Vanderbilt University Clinical Research Center. In addition to the clinic visits, you will be asked to complete study logs at home. All study materials will be provided at no cost and you will not be asked to change your current treatment.

If you are interested and meet the following criteria:

- Diagnosis of fibromyalgia
- Are 18-70 years old
- Do not have a pacemaker
- Have not recently used TENS
